DiTrollo Flexographic Institute Approved by the Department of Veterans' Affairs

Chicago/Broadview, IL - March 15, 2007- In an ongoing effort to do its part in assisting returning military personnel, DiTrollo Flexographic Institute has gone through an arduous application process of becoming approved by the Department of Veteran's Affairs as a post secondary educational institution for Veterans.

With this approval, DiTrollo Flexographic Institute will be able to continue to provide training and career education to a greater number of eligible veterans who will now be able to access military benefits while attending training at DiTrollo Flexographic Institute. As a veteran, Vincent DiTrollo understands that the educational benefits awarded to veterans as an invaluable resource and opportunity. "It is with great pride, we are able to extend this opportunity and support to our military veterans."

About Flexography

Flexography (also called surface printing, or "flexo"), is a method of printing commonly used for packaging. (Packaging is the fourth largest industry in the U.S.) Typical products printed using flexography include brown cardboard boxes, flexible packaging including retail and shopping bags, food and hygiene bags and sacks, flexible plastics, self adhesive labels, and wallpaper. More than 40 major newspapers now eschew the more common offset lithography process in favor of flexo. It's estimated that more than 90% of the items in a grocery store are printed on a flexographic printing press. Currently flexography is taking over approximately 7% of the printing industry each year. Already holding about 50% of the printing market, it's likely that flexography eventually will be the method used for almost everything that is printed.

About the DiTrollo Flexographic Institute

The DiTrollo Flexographic Institute, Inc. was founded to meet the flexographic industry's need for quality, off-site training to counter the problems of on-the-job training: wasted production and equipment time, wasted raw materials, and inconsistent skill sets. The institute offers industry-specific training seminars for all skill levels – from beginning press operations to advanced printing applications – and features a state-of-the-art environment where new press operators and seasoned industry professionals alike can gain hands-on exposure to printing and finishing processes.
